

The Festival **CODED CULTURES** founded by 5super.net in Vienna is based on multinational exchange contexts and explores new artistic creative ability-profiles within media integrated delineation cultures and digital media related arts. The last edition of the festival focused on Japan and Europe with a special perspective on project cultures and their creative codes on the intersection of Art, Science, Technology and Design.

Japan Media Arts Festival

文化庁メディア芸術祭

The **Japan Media Arts Festival** is not only focusing on the media art, but also exhibiting typical Japanese pop culture such as animation, manga and games. It is probably the first hybrid festival, which puts highlight on diverse current Japanese forms of expression. Besides the exhibition of award-winning works in Tokyo, the Japan Media Arts Festival collaborates with international festivals introducing and sharing latest information and art works in the aforementioned fields.

Exchange Emergences

19.08. - 04.09.2010

Opening:

19.08. / 7 p.m.

Location:

Dortmunder Kunstverein e.V.
Hansastraße 2-4, 44137 Dortmund
www.dortmunder-kunstverein.de

curated by

Japan Media Arts Festival

文化庁メディア芸術祭

Credits:

Coordination: Georg Russegger,
Matthias Tarasiewicz, Michal Wlodkowski
Coordination JMAF: Asami Hosokawa

CODED CULTURES is supported by:

Exchange Emergences

Joint-showcase of CODED CULTURES Festival and Japan Media Arts Festival

The cooperation between CC and JMAF has been established during the »Japan – Austria Year 2009«. It opened the opportunity to exchange emerging artistic projects, ideas and cultural references and led to a rich network of creative contents and project-based interactions between artists, scientists, designers and the participating audience. This year it is a great opportunity to collaborate again at the ISEA2010 in the Cultural Capital of Europe Ruhr. It is the first time to realize a collaborative show with selected artists from each festival.

Common Flowers / White Out

'Common Flowers / White Out' uses Suntory Flowers Moondust line of commercially available genetically-modified blue carnations as a model organism. The petal colour of the unmodified carnation was originally white, but by introducing genes responsible for a change in the colour producing genetic pathways, Suntory managed to create and commercially distribute blue carnations. The goal of this project is to remove the genetic modification responsible for the blue colour and return the flower to its 'original', 'natural', 'pure' white state. <http://bcl.biopresence.com>

Braun Tube Jazz Band

Braun tube televisions are discarded in large numbers nowadays. In summer 2011, analog broadcasting will be phased out and analog televisions will lose their intrinsic value in Japan. Giving it some attention and through a process of trial and error, I discovered its inner workings. I developed some substantive experiments: 1.) Light patterns are created by the audio signal from the cable. 2.) When I take moving images of the patterns and transform them back into sound, I can hear the same source audio that was being sent from the cable. Though deterioration of the visual representation of the source, the images can be transformed back into sound! Applying this technique I developed a performative style using my hands as pseudo antennas playing several tube televisions with a VCR as a percussion instrument - a light synthesizer. When a performer touches the TV display, light reacts and interacts to sound, which expands the performance into audio and visual stimuli. <http://crabfeet.blogspot.com>

moids 2.0 - acoustic emergence structure

The presented work moids 2.0 is the second version of our basic theme. After several pursuits, we came to focus on acoustics that emerge as a result of an organic and decentralized process. The core element of this acoustic emergence is what we call a "single reactive unit" consisting of an audible signal device, a microphone and a microchip. It generates audible signals when sound comes in. To realize a structure where units can be evenly arranged, we use an equilateral triangular metal frame and put a unit on each edge. The three units form fuzzy acoustic loops and react to the surrounding acoustic. By connecting metal frames, the acoustic structures and loops can be combined while maintaining distances, angles and of course the acoustic relation of units. We constructed a mass of units with hacking electro-acoustic devices and try to find an acoustic emergence that is possible with these potential existence only. Compared to a single function unit, how different will the acoustic emergence be? <http://moids.org>

Origami Space Race

Origami Space Race is an initiative project for an alternative space program based on open source strategies. The project's aim is a turn in the approach to the space technology into a more open perception and greater accessibility of space. The Origami Space Race started in 2008 between two different positions: scientific and artistic. The race is about developing the best origami space airplane, with the final goal of initiating the open source space program as an alternative to official space programs. www.sasosedlacek.com
